### MICROFILLED LIGHT CURE COMPOSITES

*Previously asked On apr-95,oct-98,apr-2000*

**Contents:**

- 1.Introduction
- 2.History
- 3.Classification
- 4.Composition
- 5.Indications

- 7.Properties
- 8.Advantages
- 9.Disadvantages

### INTRODUCTION

The microfilled composites were introduced soon after the traditional composites. They were developed to overcome the problems of surface roughness and low translucency associated with traditional composite.

The microfilled composites are agglomerates of 0.01-0.1micrometre inorganic silica particles embedded in 5-50micrometre resin filler particles.

### HISTORY

In 1970's microfilled and light cured composites were introduced.

Unmute Stop Video Share Participants More

9:08 AM Zoom Meeting: Light curing system... Leave

The microfilled composites are polymerized by using visible light of 400-500nm.  
The blue region of the visible light spectrum  
The photoinitiator will be camphorquinone of 0.2%  
Amine accelerator : dimethylaminoethyl-methacrylate(DMAEMA)

### Heterogenous microfilled composite

The particle size is 40nm of silica  
Prepolymerised resin particles containing 40nm of silica  
Indicated in low stress and subgingival areas where reduced shrinkage is essential

### Homogenous microfilled composite

- The particle size is 40nm
- Indicated in low stress and subgingival areas where high luster and polish is required.

## MARGINAL BREAKDOWN:

- Marginal breakdown along the unsupported margin.
- This breakdown further increases the gap width and larger molecules enter into the pulp causing marginal staining.
- Amalgam has less leakage.

### FLUORIDE RELEASING CEMENTS.

(AUG 2019)  
-M.S.SNEHA.

Emerging evidence has shown that **compomers** and **glass ionomer cements** are able to absorb **fluoride** from the oral environment when their own **fluoride** stores are depleted, a process described as 'recharging'. The material can then release this stored **fluoride** when the **fluoride** concentration in the oral environment falls, thus exposing the teeth to **fluoride** for longer. This recharging ability is not as effective in **compomers** as it is in **glass ionomers cements**.

# LUTING AGENTS

N. SNEHA  
BDS SECOND YEAR

**LUTING AGENTS:-** A luting agent is an application of a dental cement connecting the underlying tooth structure to a fixed prosthesis  
To lute means to glue two different structures together.

**LUTING MECHANISM**  
By Schillinburg

- Non-Adhesive:
  - Cement fills the restoration-tooth gap and holds by engaging in small surface irregularities.
- Micromechanical Bonding:
  - Surface irregularities are enhanced by air abrasion or acid etching
  - Improves the frictional retention.
- Molecular Bonding:
  - Chemical bond formation between cement and the tooth structure.
